

# Nine-point circle, pedal circle and cevian circle

Ngo Quang Duong

August 30, 2015

## Abstract

This paper contains some results around nine-point circle, pedal circle, cevian circle and their intersections. These are results, solutions that found by many people who interested in geometry. My contribution is just a little. Writing this, I want to make a collection, as detail as I can of these circles. I am just a normal student with great love for geometry, especially plane geometry, I am sure that I can't do this alone. I really want to say thanks to Mr. Tran Quang Hung - my teacher, Nguyen Van Linh, Telv Cohl, Tran Minh Ngoc, Luiz Gonzalez, who inspired me so much. One more thing, now I am seniors of high school, many pressure is coming so this is may be the last great paper in this year. Today, finally I finish this work. I hope all of you love this.

## 1 Common points of nine-point circle, pedal circle, cevian circle other than Poncelet point

### 1.1 Nine-point circle and pedal circle

**Theorem 1. (Fontene's first theorem)**  $\triangle ABC$  and a point  $P$ .  $\triangle A'B'C'$ ,  $\triangle DEF$  are pedal triangles of the circumcenter and  $P$  wrt  $\triangle ABC$ .  $EF, FD, DE$  intersects  $B'C', C'A', A'B'$  at  $X, Y, Z$ . Then  $DX, EY, FZ$  are concurrent at a common point of  $\odot(DEF)$  and  $\odot(A'B'C')$ .

**Proof.** Let  $O$  be circumcenter of  $\triangle ABC$ .

**Lemma 2.** Orthopole of  $P$  is also the anti-Steiner point of  $OP$  wrt  $\triangle A'B'C'$ .

Let  $T$  be the anti-steiner point of  $OP$ ,  $A_1, B_1, C_1$  are reflections of  $T$  in  $B'C', C'A', A'B'$ . Then  $A_1, B_1, C_1$  lie on  $OP$ .

$$(A_1B', A_1C') = (TC', TB') = (A'C', A'B') = (AC, AB) = (AB', AC')$$

$\Rightarrow A_1$  lies on the circle that has diameter  $OA$ , so  $AA_1 \perp OP$ . Similarly,  $BB_1, CC_1 \perp OP$ . We also have the lines that pass through  $A_1, B_1, C_1$  and pendicular to  $BC, CA, AB$ , respectively are concurrent at  $T$ . Then  $T$  is the orthopole of  $OP$  wrt  $\triangle ABC$ .

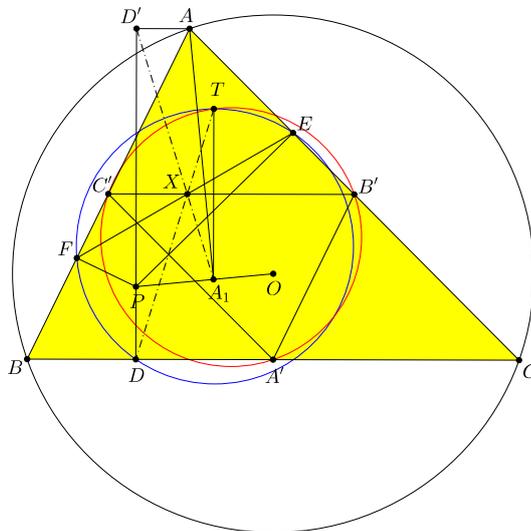

Figure 1

**Back to the main proof.**

Let  $D'$  be the reflection of  $D$  in  $B'C' \Rightarrow AD' \parallel BC$ . Then  $A', A, E, F, P, A_1$  are concyclic.

$$(A_1X, A_1D') = (A_1X, A_1F) + (A_1F, A_1D') = (C'X, C'F) + (AF, AD') = (C'B', C'A) + (BA, BC) = 0$$

$\Rightarrow A_1, D', X$  are collinear. Since  $D, T$  are the reflections of  $D', T$  in  $B'C'$  then  $DX$  pass through  $T$ .  
Cause  $D', A_1, E, F$  are concyclic:

$$\overline{XT} \cdot \overline{XD} = \overline{XD'} \cdot \overline{XA_1} = \overline{XE} \cdot \overline{XF}$$

Hence, the pedal circle of  $P$  wrt  $\triangle ABC$  passes through  $T$ .  
Similarly,  $EY, FZ$  pass through  $T$ .

**Theorem 3. (Fontene's second theorem)** *Given a line that passes through circumcenter of  $\triangle ABC$ , a point  $P$  varies on it then pedal circle of  $P$  wrt  $\triangle ABC$  always passes through a fixed point*

From the proof of Fontene's first theorem, the pedal circle of  $P$  wrt  $\triangle ABC$  passes through the orthopole of that line wrt  $\triangle ABC$  - which is a fixed point.

**Corollary 4. (Nguyen Van Linh)** *Let  $O'$  be circumcenter of  $\triangle DEF$ , then  $O'$  is orthocenter of  $\triangle XYZ$ .*

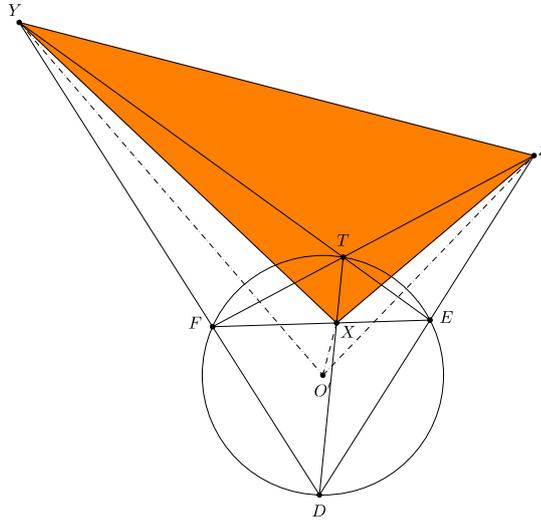

Figure 2

**Proof.** According to Fontene's first theorem,  $DX, EY, FZ$  pass through  $T$  on  $(DEF)$ . So, just simply by Brocard's theorem,  $O'$  is orthocenter of  $\triangle XYZ$ .

**Theorem 5. (Fonterne's third's theorem)** *Pedal circle of  $P$  wrt  $\triangle ABC$  is tangent to nine-point circle of  $\triangle ABC$  if and only if  $P, P'$  (isogonal conjugate of  $P$  wrt  $\triangle ABC$ ) and circumcenter of  $\triangle ABC$  are collinear.*

**Proof.** Let  $T'$  be anti-Steiner point of  $OP'$  wrt  $\triangle A'B'C'$  and  $\triangle D'E'F'$  is pedal triangle of  $P'$  wrt  $\triangle ABC$ . Since  $P, P'$  are isogonal conjugate points wrt  $\triangle ABC$  so  $D, E, F, D', E', F'$  are concyclic. Hence  $T'$  is a common point other than  $T$  of  $\odot(DEF)$  and nine-point circle of  $\triangle ABC$ . So pedal circle of  $P$  wrt  $\triangle ABC$  is tangent to nine-point circle of  $\triangle ABC$  if and only if  $T \equiv T'$ , or equivalently, anti-Steiner point of  $OP$  coincides with anti-Steiner point of  $OP'$  wrt  $\triangle A'B'C'$   $\Leftrightarrow P, O, P'$  are collinear.

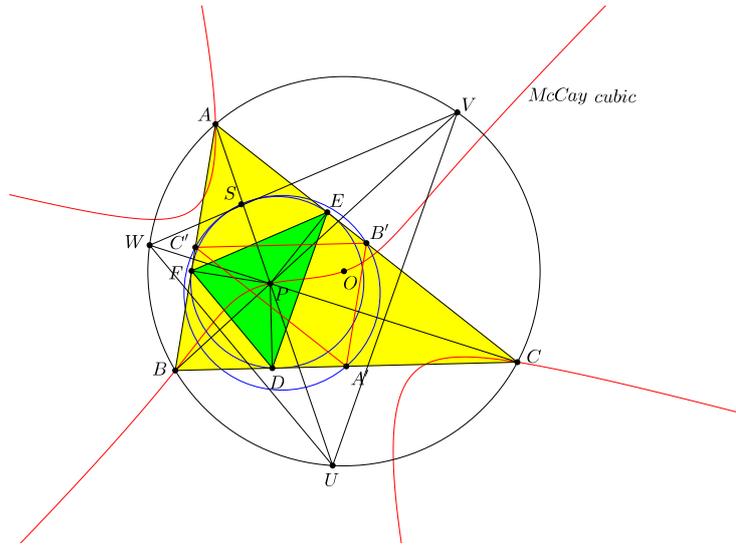

Figure 3. McCay cubic

**Note.** When  $P$  coincides with incenter or excenters, we get the famous Feuerbach's theorem. Furthermore, locus of  $P$  that  $P, O, P'$  are collinear is McCay cubic, it has barycentric equation:

$$x(c^2y^2 - b^2x^2)(b^2 + c^2 - a^2) + y(a^2z^2 - c^2x^2)(c^2 + a^2 - b^2) + z(b^2x^2 - a^2y^2)(a^2 + b^2 - c^2) = 0$$

This cubic has many interesting properties, such as: pedal triangle and circumcevian triangle of  $P$  on McCay cubic wrt  $\triangle ABC$  are homothetic. Until now, new properties of McCay cubic are still being found. Because of the framework of this paper, author won't mention in detail so reader can see more properties of McCay cubic in Reference.

**Proposition 6. (AoPS)** *Simson line of  $T$  wrt  $\triangle D'E'F'$  is parallel to  $OP$ .*

**Proof.** At first, we introduce a lemma.

**Lemma 7. (Telv Cohl)**  *$(O)$  is a fixed circle and  $BC$  is a fixed chord of  $(O)$ ,  $P$  is a fixed point.  $A$  varies on  $(O)$ .  $\triangle DEF$  is pedal triangle of  $P$  wrt  $\triangle ABC$ ,  $T$  is orthopole of  $OP$  wrt  $\triangle ABC$  then  $\angle(DF, DT)$  is a fixed when  $A$  varies on  $(O)$ .*

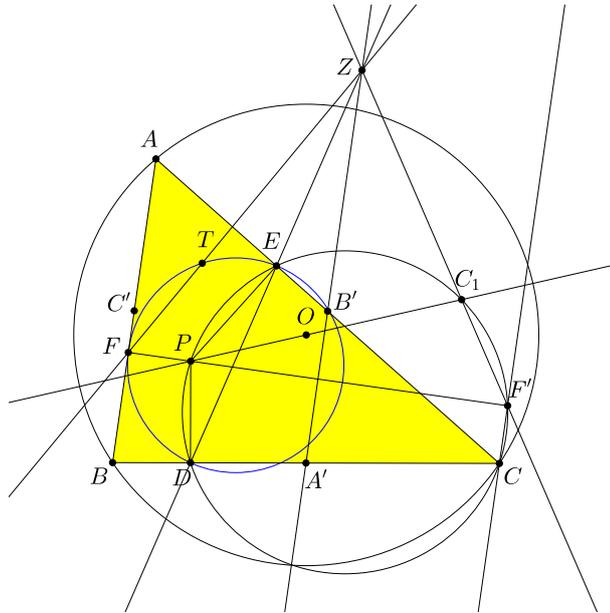

Figure 4

Proof of this lemma is given also by Telv Cohl.

Let  $C_1, F'$  be orthogonal projections of  $C$  on  $OP, PF$ . From the proof of Fontene's first theorem above,

we have:  $F'C_1, A'B', DE, TF$  are concurrent at  $Z$ .

$$\begin{aligned}
(FD, FT) &= (FD, FP) + (FP, FT) \\
&= (BD, BP) + (F'Z, F'P) (\triangle ZFF' \text{ is isoceles}) \\
&= (BC, BP) + (F'C_1, F'P) \\
&= (BC, BP) + (CC_1, CP) \\
&= (BC, BP) + (OP, PC) + \frac{\pi}{2} \\
&= \text{constant}
\end{aligned}$$

Now, back to the main problem. Let  $U, V$  be orthogonal projections of  $T$  on  $E'F', F'D'$ .

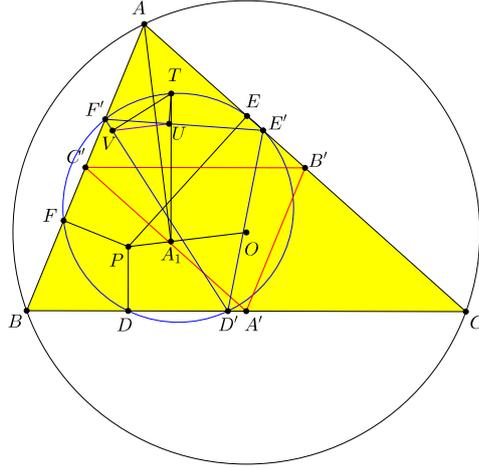

Figure 5

$$\begin{aligned}
(UV, UT) &= (E'D', E'T) \\
&= (E'D, E'T) + (E'D', E'E) + (E'E, E'D) \\
&= (FD, FT) + (PC, PE) + (FE, FD) \\
&= (BC, BP) + (OP, PC) + \frac{\pi}{2} + (PC, PE) + (FE, FP) + (FP, FD) \\
&= (BC, BP) + (OP, PC) + (CP, CA) + (AC, AP) + (BP, BC) \\
&= (OP, AP)
\end{aligned}$$

Since  $AP \perp E'F', TU \perp E'F'$  then  $AP \parallel TU$ .

$\implies UV \parallel OP \Leftrightarrow$  Simson line of  $T$  wrt  $\triangle D'E'F'$  is parallel to  $OP$ .

**Proposition 8. (Tran Quang Hung)** A line that passes through  $D$  and parallel to  $PA$  intersects the  $A$ -altitude of  $\triangle ABC$  at  $D''$ .  $E'', F''$  are determined similarly.

Prove that the circles that have diameter  $DD'', EE'', FF''$  pass through  $T$ .

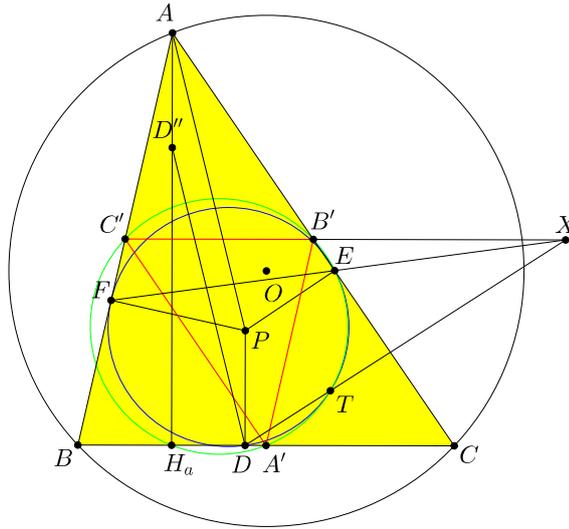

Figure 6

**Proof(based on Nguyen Van Linh's).** Since  $AD'' \parallel PD$ ,  $AP \parallel DD''$  then  $APDD''$  is a parallelogram.  $\Rightarrow$  Midpoint of  $AP$  is reflection of midpoint of  $DD''$  in intersection of  $AD, PD''$ , which is midpoint of  $AD$  and lies on  $B'C'$ .  $\Rightarrow \odot(DD'')$  is reflection of  $(PA)$  in  $B'C'$  so  $B'C'$  is radical axis of  $\odot(DD'')$  and  $\odot(PA)$ .

Let consider three circles  $\odot(DD'')$ ,  $\odot(PA)$ ,  $\odot(DEF)$ :

$B'C'$  is radical axis of  $\odot(DD'')$  and  $\odot(PA)$ .

$EF$  is radical axis of  $\odot(PA)$  and  $\odot(DEF)$ .

So  $X$  is radical center of  $\odot(DD'')$ ,  $\odot(PA)$ ,  $\odot(DEF)$ . Since  $D$  lies on  $\odot(DEF)$ ,  $\odot(DD'')$ ,  $XD$  is radical axis of  $\odot(DEF)$ ,  $\odot(DD'')$ . Furthermore, from Fontene's first theorem,  $T, X, D$  are collinear,  $T$  lies on  $XD$  so  $T$  lies on  $(DD'')$ . Similarly,  $\odot(EE'')$ ,  $\odot(FF'')$  pass through  $T$ .

**Proposition 9. (Tran Quang Hung)** Given  $\triangle ABC$ , let  $P$  be an arbitrary point,  $\triangle DEF$  be the pedal triangle of  $P$  wrt  $\triangle ABC$ .  $R$  is radius of  $\odot(DEF)$ .

$P'$  is the isogonal conjugate of  $P$  wrt  $\triangle ABC$ .  $D_1, E_1, F_1$  are reflections of  $P$  in  $D, E, F$ ,  $PD_1, PE_1, PF_1$  intersect  $\odot(D_1E_1F_1)$  at  $D_2, E_2, F_2 \neq D_1, E_1, F_1$ . Then  $AD_2, BE_2, CF_2$  are concurrent at a point on  $\odot(P'; 2R)$ .

In this problem, we introduce 2 proofs.

**Proof 1(by Nguyen Van Linh).**

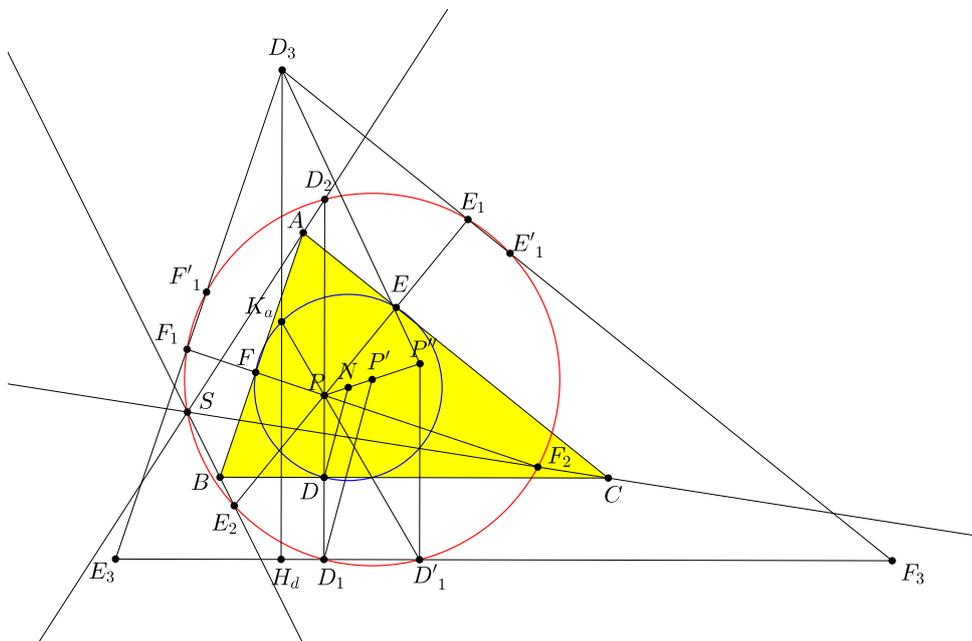

Figure 7

Let  $N$  be midpoint of  $PP'$ . It is well-known that  $N$  is circumcenter of  $\triangle DEF$  so  $ND = \mathcal{R}$ . From Thales's theorem,  $P'D_1 = 2ND = 2\mathcal{R}$ . Similarly,  $P'E_1 = P'F_1 = 2\mathcal{R}$  so  $D_1, E_1, F_1$  lie on  $\odot(P', 2\mathcal{R})$ .

$$\begin{aligned} \mathcal{H}_P^2 : \odot(DEF) &\rightarrow \odot(D_1E_1F_1) \\ A, B, C, P' &\rightarrow D_3, E_3, F_3, P'' \end{aligned}$$

$\odot(D_1E_1F_1)$  intersects  $E_3F_3$  at  $D'_1 \neq D_1$  then  $P''D'_1 \perp E_3F_3$ .  $K_a$  is a point on the altitude  $DH_d$  such that  $K_aD_3P''D'_1$  is a parallelogram.  $J$  is circumcenter of  $\triangle D_3E_3F_3$ . Then from problem 9,  $\odot(H_dK_aD'_1)$  passes through orthopole  $S$  of  $JP''$  wrt  $\triangle D_3E_3F_3 \Rightarrow K_aS \perp SD'_1$ . Since  $D'_1D_2$  is diameter of  $\odot(D_1E_1F_1)$ ,  $D_2S \perp SD'_1$ . Therefore,  $D_2, K_a, S$  are collinear.

From the homothety  $\mathcal{H}_P^2$ , we get  $\overrightarrow{PD_2} = \overrightarrow{D'_1P''} = \overrightarrow{K_aD_3}$  then  $D_3K_aPD_2$  is a parallelogram.  $A$  is midpoint of  $PD_3 \Rightarrow A$  is midpoint of  $K_aD_2$ , this means  $A, K_a, D_2$  are collinear.

$\Rightarrow A, D_2, K_a, S$  are collinear. So  $AD_2$  passes through  $S$ . Similarly,  $AD_2, BE_2, CF_2$  are concurrent at  $S$ .

**Proof 2.** This second proof uses the same notations as the first proof.

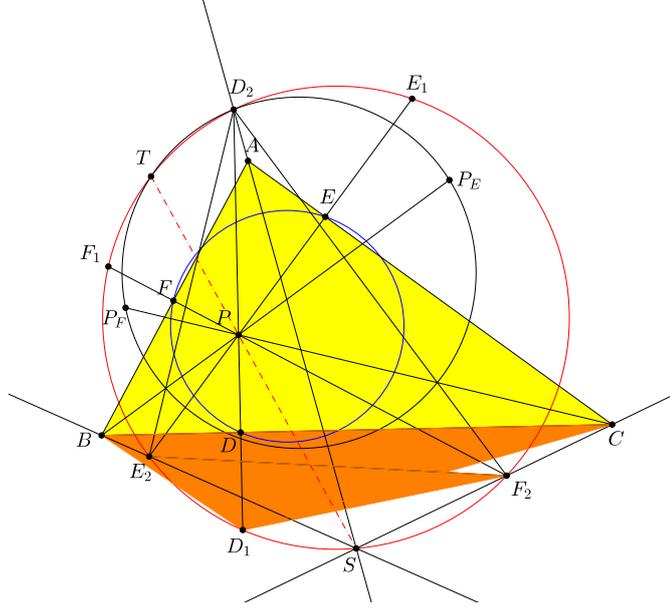

Figure 8

Since  $A$  is circumcenter of  $\triangle PE_1F_1$  and  $E_1, F_1, E_2, F_2$  are concyclic

$\Rightarrow PA \perp E_2F_2$ . Similarly,  $PB, PC \perp F_2D_2, D_2E_2$ .

$\Rightarrow$  Two orthologic centers of  $\triangle ABC$  and  $\triangle D_2E_2F_2$  coincide with each other. So from Sondat's theorem,  $AD_2, BE_2, CF_2$  are concurrent. Let  $S$  be their concurrency point.

$$(BD_1, BC) = (BC, BP) = (D_2P, D_2F_2) = (D_2D_1, D_2F_2) = (E_2D_1, E_2F_2)$$

$$(CD_1, CB) = (CB, CD) = (D_2E_2, D_2P) = (D_2E_2, D_2D_1) = (F_2E_2, F_2D_1)$$

Hence  $\triangle D_1BC$  and  $\triangle D_1E_2F_2$  are directly similar.

$\Rightarrow (SE_2, SF_2) = (BE_2, CF_2) = (D_1E_2, D_1F_2) \Rightarrow S$  lies on  $\odot(D_2E_2F_2)$ .

**Remark.** Let  $P_D, P_E, P_F$  be reflections of  $P$  in  $E_2F_2, F_2D_2, D_2E_2$ .

The inversion  $\mathbf{I}(P, \overline{PD}, \overline{PD_2}) : B, C, D_1, S \rightarrow P_E, P_F, D_2, T$

Since  $B, C, D_1, S$  are concyclic,  $\odot(D_2P_E P_F)$  passes through  $T$ . Similarly,  $\odot(E_2P_F P_D), \odot(F_2P_D P_E)$  pass through  $T$ . It is well-known that  $\odot(D_2P_E P_F), \odot(E_2P_F P_D), \odot(F_2P_D P_E)$  are concurrent at anti-Steiner point of  $HP$  wrt  $\triangle D_2E_2F_2$  where  $H$  is orthocenter of  $\triangle D_2E_2F_2$ .

Hence  $T, P$ , anti-Steiner point of  $HP$  wrt  $\triangle D_2E_2F_2$  are collinear.

## 1.2 Cevian circle and Nine-point circle

In this part, we use notation as follow:  $\triangle ABC$  and a point  $P$ .  $PA, PB, PC$  intersects  $BC, CA, AB$  at  $D, E, F$ ;  $X, Y, Z$  are the intersections of  $(BC, EF), (CA, FD), (AB, DE)$ ;  $A', B', C'$  are midpoint of  $BC, CA, AB$ .

**Proposition 10.** *Let  $M$  be Miquel point of the complete quadrilateral  $EF, FD, DE, \overline{XYZ}$ . Then  $M$  is an intersection of  $\odot(DEF)$  and  $\odot(A'B'C')$ .*

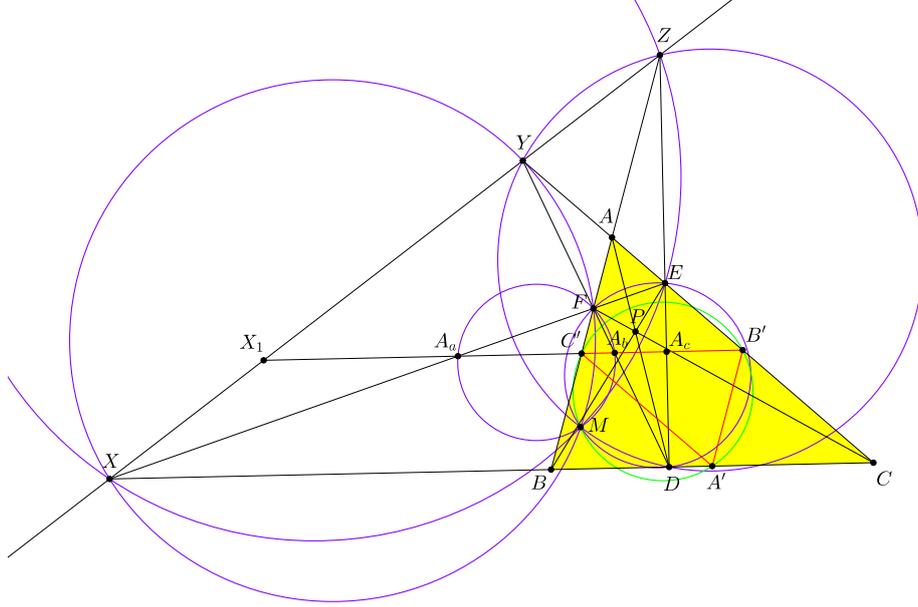

Figure 9

**Proof.**  $B'C'$  intersects  $DE, DF, EF, \overline{X, Y, Z}$  at  $A_c, A_b, A_a, X_1$ , respectively.

We will show that  $\odot(FA_bA_a)$  passes through  $M$  by ratio of power. First, from Thales's theorem:

$$\frac{\overline{A_aE}}{\overline{A_aX}} = \frac{\overline{B'E}}{\overline{B'C}}$$

Since  $(EYAC) = -1$ ,  $B'$  is midpoint of  $CA$  then according to Newton's formula:  $\overline{B'C}^2 = \overline{B'E} \cdot \overline{E'Y}$

$$\Rightarrow \frac{\overline{B'E}}{\overline{B'C}} = \frac{\overline{B'C}}{\overline{B'Y}} = \frac{\overline{A_bD}}{\overline{A_bY}}$$

$$\frac{\mathcal{P}_{A_a/\odot(DEF)}}{\mathcal{P}_{A_a/\odot(FXY)}} = \frac{\overline{A_aE} \cdot \overline{A_aF}}{\overline{A_aF} \cdot \overline{A_aX}} = \frac{\overline{A_aE}}{\overline{A_aX}}$$

$$\frac{\mathcal{P}_{A_b/\odot(DEF)}}{\mathcal{P}_{A_b/\odot(FXY)}} = \frac{\overline{A_bD} \cdot \overline{A_bF}}{\overline{A_bF} \cdot \overline{A_bY}} = \frac{\overline{A_bD}}{\overline{A_bY}}$$

$$\Rightarrow \frac{\mathcal{P}_{A_a/\odot(DEF)}}{\mathcal{P}_{A_a/\odot(FXY)}} = \frac{\mathcal{P}_{A_b/\odot(DEF)}}{\mathcal{P}_{A_b/\odot(FXY)}}$$

Hence  $\odot(DEF), \odot(FXY), \odot(FA_aA_b)$  are coaxial, then  $\odot(FA_aA_b)$  passes through  $M$ .

Similarly, also by ratio of power, associate with Miquel's theorem, circumcircle of triangles formed by 3 in set of 6 lines  $B'C', C'A', A'B', EF, FD, DE$  passes through  $M$ . Therefore,  $\odot(A'B'C')$  passes through  $M$ .

**Corollary 11. (Telv Cohl)** *Steiner line of  $M$  wrt  $\triangle DEF$  passes through circumcenter  $O$  of  $\triangle ABC$ .*

**Proof.** Since circumcircle of triangles formed by 3 in set of 6 lines  $B'C', C'A', A'B', EF, FD, DE$  passes through  $M$  then Steiner line of  $M$  wrt  $\triangle DEF$  passes through orthocenters of triangles formed by 3 in those lines, which contain  $O$  - orthcenter of  $\triangle A'B'C'$ .

**Remark.** Let  $H_P$  be orthocenter of  $\triangle DEF$  then  $M$  is orthopole of  $OH_P$  wrt  $\triangle ABC$ .

**Proposition 12.**  $AH_a$  is the altitude of  $\triangle ABC$ .

$XX_1A_aH_a, DH_aA_bA_c$  are isocetes trapezoid.

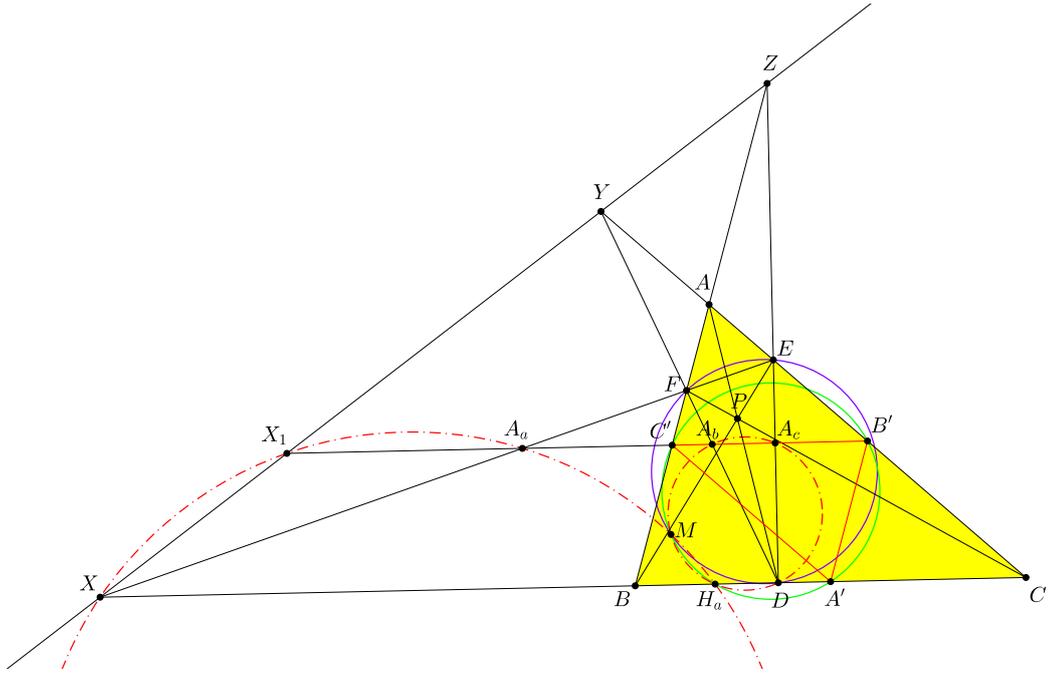

Figure 10

**Proof.** Since  $B'C' \parallel BC$  then we only have to show that  $\odot(XX_1A_a)$  and  $\odot(DA_bA_c)$  pass through  $H_a$ . From the proof of problem 11,  $\odot(XX_1A_a), \odot(DA_BA_c)$  pass through  $M$ .

$$\frac{\mathcal{P}_{B'/\odot(XX_1A_a)}}{\mathcal{P}_{B'/\odot(DA_bA_c)}} = \frac{\overline{B'X_1} \cdot \overline{B'A_a}}{\overline{B'A_b} \cdot \overline{B'A_c}} = \frac{\overline{B'X_1}}{\overline{B'A_b}} \cdot \frac{\overline{B'A_a}}{\overline{B'A_c}} = \frac{\overline{CX}}{\overline{CD}} \cdot \frac{\overline{CX}}{\overline{CD}} = \frac{CX^2}{CD^2}$$

$$\frac{\mathcal{P}_{C'/\odot(XX_1A_a)}}{\mathcal{P}_{C'/\odot(DA_bA_c)}} = \frac{\overline{C'X_1} \cdot \overline{C'A_a}}{\overline{C'A_b} \cdot \overline{C'A_c}} = \frac{\overline{C'X_1}}{\overline{C'A_b}} \cdot \frac{\overline{C'A_a}}{\overline{C'A_c}} = \frac{\overline{BX}}{\overline{BD}} \cdot \frac{\overline{BX}}{\overline{BD}} = \frac{BX^2}{BD^2}$$

Since  $(BCDX) = -1$

$$\Rightarrow \frac{\mathcal{P}_{B'/\odot(XX_1A_a)}}{\mathcal{P}_{B'/\odot(DA_bA_c)}} = \frac{\mathcal{P}_{C'/\odot(XX_1A_a)}}{\mathcal{P}_{C'/\odot(DA_bA_c)}}$$

Hence  $\odot(A'B'C'), \odot(DA_BA_c), \odot(XX_1A_a)$  are coaxial.

$$\frac{\overline{A'X}}{\overline{A'D}} = \frac{\mathcal{P}_{B'/\odot(XX_1A_a)}}{\mathcal{P}_{B'/\odot(DA_bA_c)}}$$

This is true, because:

$$\frac{\overline{A'X}}{\overline{A'D}} = \frac{\overline{DX} \cdot \overline{A'D}}{\overline{DA'} \cdot \overline{DX}} = -\frac{\overline{XB} \cdot \overline{XC}}{\overline{DB} \cdot \overline{DC}} = \frac{BX^2}{BD^2} = \frac{\mathcal{P}_{B'/\odot(XX_1A_a)}}{\mathcal{P}_{B'/\odot(DA_bA_c)}}$$

This means the second common point of  $\odot(A'B'C'), \odot(DA_BA_c), \odot(XX_1A_a)$  lies on  $BC$ . But  $\odot(A'B'C')$  intersects  $BC$  at  $A', H_a$  then  $H_a$  lies on  $\odot(XX_1A_a), \odot(DA_bA_c)$ .

**Proposition 13.** (Similar to Fontene's first theorem)  $\odot(DEF)$  intersects  $BC, CA, AB$  at  $D', E', F' \neq D, E, F$ .

$D'A_a, E'B_b, F'C_c$  pass through  $M$ .

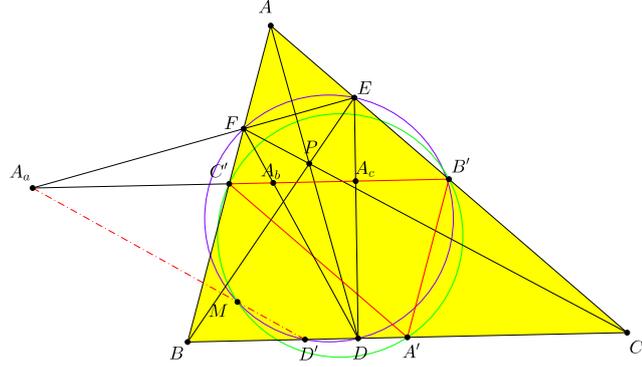

Figure 11

**Proof.** From symmetry, it is suffice to prove that  $D', A_a, M$  are collinear.

$$(MA_a, MD') = (MA_a, MF) + (MF, MD') = (A_b A_a, A_b F) + (DF, DD') = (A_b A_a, DD') = 0$$

**Proposition 14.**  $L_a, L_b, L_c$  lie on the altitudes of  $\triangle ABC$  such that  $D'L_a E'L_b, F'L_c$  are pendicular to  $EF, FD, DE$ .  $\odot(D'L_a), \odot(E'L_b), \odot(F'L_c)$  pass through  $M$ .

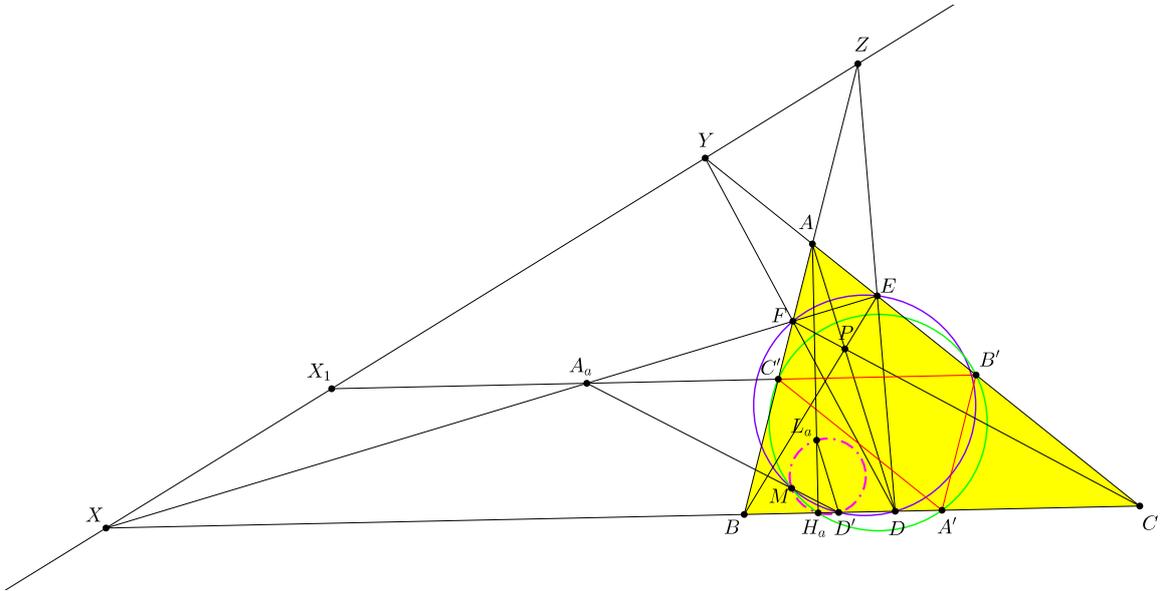

Figure 12

**Proof.** Like the above proposition, this can be solved easily by angle chasing.

$$(MH_a, MD') = (MH_a, MA_a) = (XH_a, XA_a) = (BC, EF) = (L_a H_a, L_a D')$$

$\Rightarrow M, H_a, D', L_a$  are concyclic.

**Proposition 15.**  $\odot(DYZ), \odot(EZX), \odot(FXY)$  intersects  $\odot(A'B'C')$  at  $D_1, E_1, F_1 \neq M$ .  $DD_1, EE_1, FF_1$  are concurrent at a point on  $\odot(A'B'C')$ .

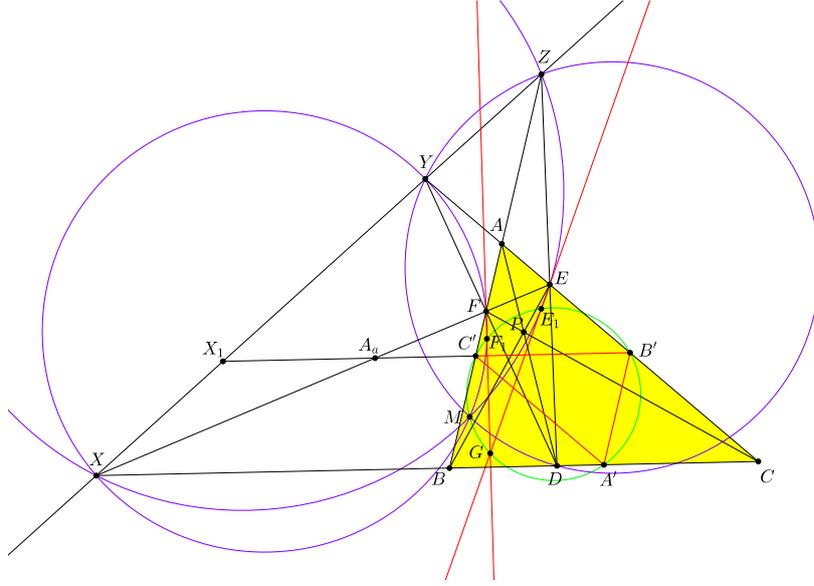

Figure 13

**Proof.**

$$(EE_1, FF_1) = (EE_1, EX) + (FX, FF_1) = (ME_1, MX) + (MX, MF_1) = (ME_1, MF_1)$$

Therefore, intersection of  $EE_1, FF_1$  lies on  $\odot(A'B'C')$ . Similarly,  $DD_1, EE_1, FF_1$  are concurrent at a point on  $\odot(A'B'C')$ .

**Proposition 16.** (Similar to Fontene's third theorem)  $P^*$  is the cyclocevian conjugate of  $P$  wrt  $\triangle ABC$ .  $H_P, H_{P^*}$  are orthocenters of cevian triangles of  $P, P^*$  wrt  $\triangle ABC$ . Then cevian circle of  $P$  wrt  $\triangle ABC$  is tangent to nine-point circle of  $\triangle ABC$  if and only if  $H_P, H_{P^*}, O$  are collinear.

**Proof.** From corollary 16, the common points of  $\odot(A'B'C')$ ,  $\odot(DEF)$  are anti-Steiner points of  $OH_P, OH_{P^*}$  wrt  $\triangle A'B'C'$  then  $\odot(A'B'C')$  is tangent to  $\odot(DEF)$  if and only if  $O, H_P, H_{P^*}$  are collinear.

Now we will find locus of  $P$  such that its cevian circle is tangent to nine-point circle.

Let  $D_2, E_2, F_2$  be midpoints of  $DX, EY, FZ$ . Then the line that passes through  $D_2, E_2, F_2$  is Gauss line of  $EF, FD, DE, \overline{X}, \overline{Y}, \overline{Z}$ .

In barycentric coordinates, let  $P(\alpha, \beta, \gamma)$ .

$$\frac{\overline{D_2B}}{\overline{D_2C}} = -\frac{\overline{BD_2} \cdot \overline{BC}}{\overline{CD_2} \cdot \overline{CB}} = -\frac{\overline{BDBX}}{\overline{CD} \cdot \overline{CX}} = \frac{DB^2}{DC^2} = \frac{\gamma^2}{\beta^2}$$

Similarly

$$\frac{\overline{E_2C}}{\overline{E_2A}} = \frac{\alpha^2}{\gamma^2} \quad \frac{\overline{F_2A}}{\overline{F_2B}} = \frac{\beta^2}{\alpha^2}$$

Then the line  $\overline{D_2, E_2, F_2}$  has equation:

$$\frac{x}{\alpha^2} + \frac{y}{\beta^2} + \frac{z}{\gamma^2} = 0$$

The cyclocevian conjugate of  $P$  has barycentric coordinate:

$$P^* \left( \frac{1}{\frac{b^2\gamma\alpha}{\gamma+\alpha} + \frac{c^2\alpha\beta}{\alpha+\beta} - \frac{a^2\beta\gamma}{\beta+\gamma}}, \frac{1}{\frac{c^2\alpha\beta}{\alpha+\beta} + \frac{a^2\beta\gamma}{\beta+\gamma} - \frac{b^2\gamma\alpha}{\gamma+\alpha}}, \frac{1}{\frac{a^2\beta\gamma}{\beta+\gamma} + \frac{b^2\gamma\alpha}{\gamma+\alpha} - \frac{c^2\alpha\beta}{\alpha+\beta}} \right)$$

$AP^*, BP^*, CP^*$  intersect  $BC, CA, AB$  at  $D', E', F', E'F', F'D', D'E'$  intersect  $BC, CA, AB$  at  $X', Y', Z'$ .

$D_3, E_3, F_3$  are midpoints of  $D'X', E'Y', F'Z'$  then similarly, the line  $\overline{D_3, E_3, F_3}$  has equation:

$$x \left( \frac{b^2\gamma\alpha}{\gamma+\alpha} + \frac{c^2\alpha\beta}{\alpha+\beta} - \frac{a^2\beta\gamma}{\beta+\gamma} \right)^2 + y \left( \frac{c^2\alpha\beta}{\alpha+\beta} + \frac{a^2\beta\gamma}{\beta+\gamma} - \frac{b^2\gamma\alpha}{\gamma+\alpha} \right)^2 + z \left( \frac{a^2\beta\gamma}{\beta+\gamma} + \frac{b^2\gamma\alpha}{\gamma+\alpha} - \frac{c^2\alpha\beta}{\alpha+\beta} \right)^2 = 0$$

Since Gauss line and Steiner line of a complete quadrilateral are perpendicular so  $O, H_P, H_P^*$  are collinear if and only if  $\overline{D_2, E_2, F_2}$  and  $\overline{D_3, E_3, F_3}$  are parallel:

$$\begin{aligned} & \left| \begin{array}{cc} \left( \frac{c^2\alpha\beta}{\alpha+\beta} + \frac{a^2\beta\gamma}{\beta+\gamma} - \frac{b^2\gamma\alpha}{\gamma+\alpha} \right)^2 & \left( \frac{a^2\beta\gamma}{\beta+\gamma} + \frac{b^2\gamma\alpha}{\gamma+\alpha} - \frac{c^2\alpha\beta}{\alpha+\beta} \right)^2 \\ \frac{1}{\beta^2} & \frac{1}{\gamma^2} \end{array} \right| \\ & + \left| \begin{array}{cc} \left( \frac{a^2\beta\gamma}{\beta+\gamma} + \frac{b^2\gamma\alpha}{\gamma+\alpha} - \frac{c^2\alpha\beta}{\alpha+\beta} \right)^2 & \left( \frac{b^2\gamma\alpha}{\gamma+\alpha} + \frac{c^2\alpha\beta}{\alpha+\beta} - \frac{a^2\beta\gamma}{\beta+\gamma} \right)^2 \\ \frac{1}{\gamma^2} & \frac{1}{\alpha^2} \end{array} \right| \\ & + \left| \begin{array}{cc} \left( \frac{b^2\gamma\alpha}{\gamma+\alpha} + \frac{c^2\alpha\beta}{\alpha+\beta} - \frac{a^2\beta\gamma}{\beta+\gamma} \right)^2 & \left( \frac{c^2\alpha\beta}{\alpha+\beta} + \frac{a^2\beta\gamma}{\beta+\gamma} - \frac{b^2\gamma\alpha}{\gamma+\alpha} \right)^2 \\ \frac{1}{\alpha^2} & \frac{1}{\beta^2} \end{array} \right| = 0 \\ \Leftrightarrow & \left( \frac{b^2\gamma\alpha}{\gamma+\alpha} + \frac{c^2\alpha\beta}{\alpha+\beta} - \frac{a^2\beta\gamma}{\beta+\gamma} \right)^2 \left( \frac{1}{\beta^2} - \frac{1}{\gamma^2} \right) + \left( \frac{c^2\alpha\beta}{\alpha+\beta} + \frac{a^2\beta\gamma}{\beta+\gamma} - \frac{b^2\gamma\alpha}{\gamma+\alpha} \right)^2 \left( \frac{1}{\gamma^2} - \frac{1}{\alpha^2} \right) + \left( \frac{a^2\beta\gamma}{\beta+\gamma} + \frac{b^2\gamma\alpha}{\gamma+\alpha} - \frac{c^2\alpha\beta}{\alpha+\beta} \right)^2 \left( \frac{1}{\alpha^2} - \frac{1}{\beta^2} \right) = 0 \\ \Leftrightarrow & \frac{b^2c^2\alpha^2\beta\gamma}{(\gamma+\alpha)(\alpha+\beta)} \left( \frac{1}{\beta^2} - \frac{1}{\gamma^2} \right) + \frac{c^2a^2\beta^2\gamma\alpha}{(\alpha+\gamma)(\beta+\gamma)} \left( \frac{1}{\gamma^2} - \frac{1}{\alpha^2} \right) + \frac{a^2b^2\gamma^2\alpha\beta}{(\gamma+\alpha)(\beta+\gamma)} \left( \frac{1}{\alpha^2} - \frac{1}{\beta^2} \right) = 0 \\ \Leftrightarrow & b^2c^2\alpha^3(\beta+\gamma)^2(\beta-\gamma) + c^2a^2\beta^3(\gamma+\alpha)^2(\gamma-\alpha) + a^2b^2\gamma^3(\alpha+\beta)^2(\alpha-\beta) = 0 \end{aligned}$$

Hence the locus is a sextic:

$$b^2c^2x^3(y+z)^2(y-z) + c^2a^2y^3(z+x)^2(z-x) + a^2b^2z^3(x+y)^2(x-y) = 0$$

This sextic is the isotomic of anticomplement of Grebe cubic(see [14]):

$$a^2x(c^2y^2 - b^2z^2) + b^2y(a^2z^2 - c^2x^2) + c^2z(b^2x^2 - a^2y^2) = 0$$

### 1.3 Intersection of pedal circle and cevian circle

**Proposition 17. (Luiz Gonzalez, Telv Cohl)** *Given  $\triangle ABC$  and a point  $P$ .  $\triangle DEF$  and  $\triangle XYZ$  are pedal triangle, cevian triangle of  $P$  wrt  $\triangle ABC$ , respectively.  $H_P$  is orthocenter of  $\triangle XYZ$ . Then anti-Steiner point of  $PH_P$  wrt  $\triangle XYZ$  is a common point of  $\odot(DEF)$  and  $\odot(XYZ)$ .*

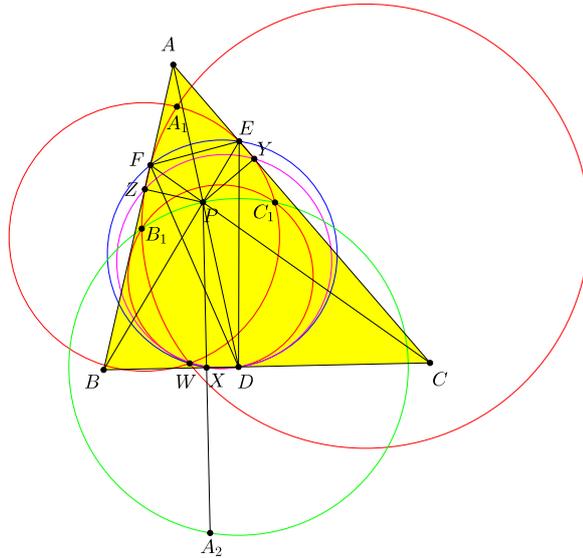

Figure 14

**Proof.**  $A_1, B_1, C_1$  are reflections of  $P$  in  $EF, FD, DE$ ;  $A_2$  is the reflection of  $P$  in  $BC$ . It is obvious that  $DA_2 = DP = DB_1 = DC_1$  so  $A_2, B_1, C_1, P$  are concyclic.

$$(DE, DF, DX, DP) = -1 \implies (PC_1, PB_1, PA_2, \perp PD) = -1$$

Therefore  $PB_1A_2C_1$  is a harmonic quadrilateral so  $D, X, B_1, C_1$  are concyclic.  
It is well-known that  $\odot(DB_1C_1), \odot(EC_1A_1), \odot(FA_1B_1)$  are concurrent at a point  $W$  - anti-Steiner point of  $PH_P$  wrt  $\triangle DEF$ .

$$\begin{aligned}
(WE, WF) &= (WE, WA_1) + (WA_1, WF) \\
&= (YE, YA_1) + (ZA_1, ZF) \\
&= (AC, YA_1) + (ZA_1, AB) \\
&= (AC, AB) + (A_1Z, A_1Y) \\
&= (AC, AB) + (PB, PC) \\
&= (CA, CP) + (BP, BA) \\
&= (DE, DP) + (DP, DF) \\
&= (DE, DF)
\end{aligned}$$

So  $W$  lies on  $\odot(DEF)$  and  $\odot(XYZ)$ .

## 2 Poncelet point

### 2.1 A proof of Poncelet point's problem

**Theorem 18. (Randy Hutson).**  $\triangle ABC$  and a point  $P$ . Prove that pedal circle, cevian circle of  $P$  wrt  $\triangle ABC$  and nine-point circle of  $\triangle ABC$  are concurrent.

**Proof(based on Tran Minh Ngoc's).**  $A', B', C'$  are midpoints of  $BC, CA, AB$ .  
 $\triangle DEF$  and  $\triangle XYZ$  are pedal triangle and cevian triangle of  $P$  wrt  $\triangle ABC$ .

By using the inversion that has center  $P$ , we get new problem:

$\triangle ABC$  and a point  $P$ .  $\triangle DEF$  is the antipedal triangle of  $P$  wrt  $\triangle ABC$ .

$A', B', C'$  are the points on  $\odot(PBC), \odot(PCA), \odot(PAB)$  such that  $PBA'C, PCB'A, PAC'B$  are harmonic quadrilateral.

$AP, BP, CP$  intersect  $\odot(PBC), \odot(PCA), \odot(PAB)$  at  $D, E, F \neq P$ . Prove that  $\odot(DEF), \odot(XYZ), \odot(A'B'C')$  are concurrent.

Let  $D', E', F'$  be the reflections of  $P$  in  $EF, FD, DE$ .  $A_1, B_1, C_1$  are midpoints of  $PA', PB', PC'$ .  
 $O_a, O_b, O_c$  are circumcenters of  $\triangle PBC, \triangle PCA, \triangle PAB$ .

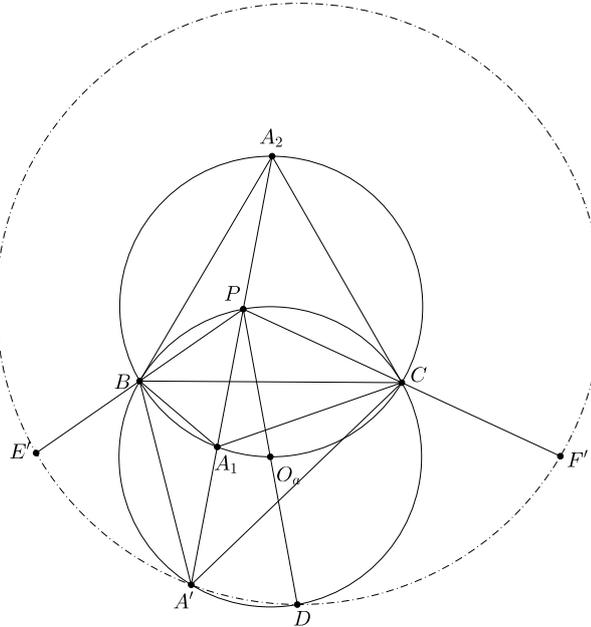

Figure 15

$PBA'C$  is a harmonic quadrilateral, then tangent lines of  $\odot(PBC)$  at  $B, C$  intersect each other at a point  $A_2$  on  $PA'$ .

$\Rightarrow B, C, O_a, A_1$  lie on a circle that has diameter  $O_aA_2$ . From the homothety  $\mathcal{H}_{(P,2)}$ ,  $E', F', D, A'$  are concyclic.

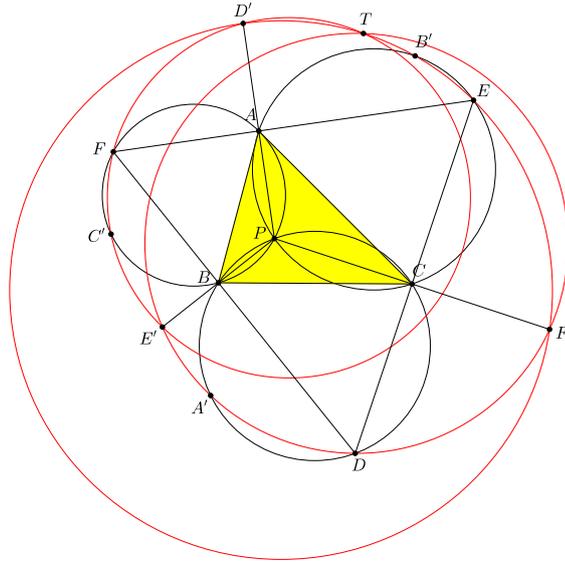

Figure 16

Since  $D', E', F'$  are reflections of  $P$  in  $EF, FD, DE$ , then  $\odot(DE'F'), \odot(EF'D'), \odot(FD'E')$  are concurrent at antisteiner point  $T$  of  $P$  wrt  $\triangle DEF$ .

We show that  $\odot(A'B'C'), \odot(XYZ)$  pass through  $T$ .

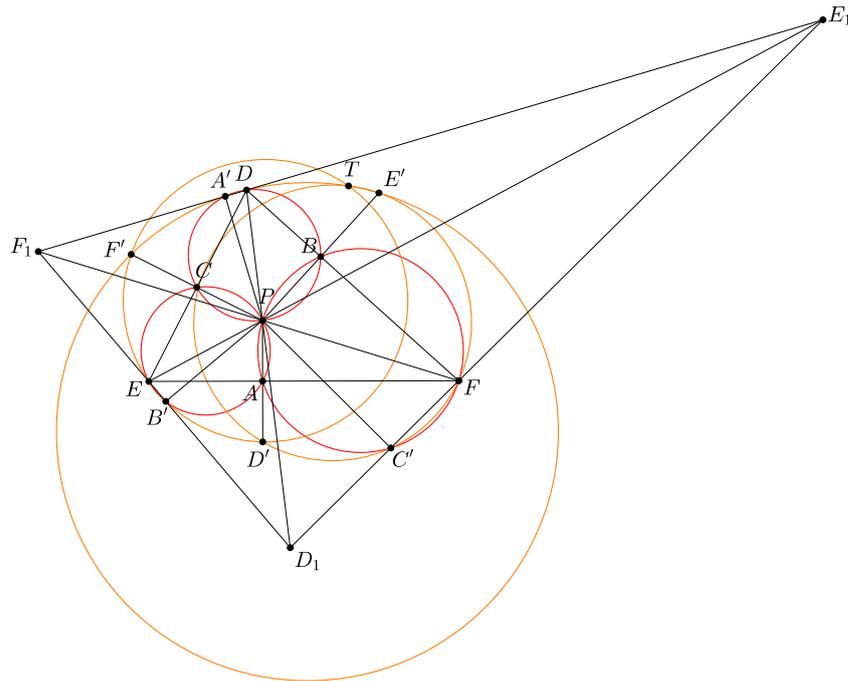

Figure 17

$B'CPA, C'APB$  are harmonic quadrilateral, then:

$$E(B'PCA) = F(C'PBA) = -1 \Leftrightarrow E(D_1PDF) = F(D_1PDE)$$

Hence  $D, P, D_1$  are collinear.

$$\begin{aligned} (A'B', A'C') &= (A'B', A'P) + (A'P, A'C') \\ &= (F_1D_1, F_1P) + (E_1P, E_1D_1) \\ &= (D_1F_1, D_1E_1) + (PE_1, PF_1) \\ &= (D_1F_1, D_1E_1) + (PE, PF) \end{aligned}$$

$$\begin{aligned}
(TB', TC') &= (TB', TD') + (TD', TC') \\
&= (EB', ED') + (FD', FC') \\
&= (D_1F_1, ED') + (FD', D_1E_1) \\
&= (D_1F_1, D_1E_1) + (D'F, D'E) \\
&= (D_1F_1, D_1E_1) + (PE, PF)
\end{aligned}$$

$\Rightarrow (A'B', A'C') = (TB', TC')$ , then  $A', B', C', T$  are concyclic.

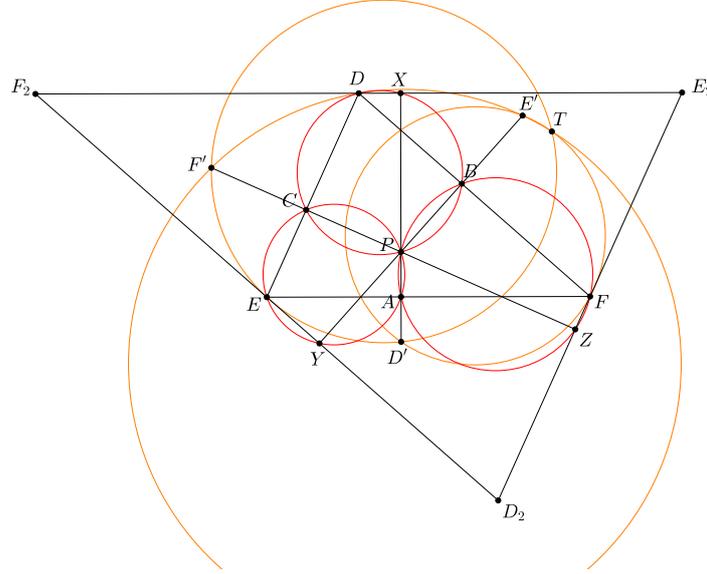

Figure 18

Let  $\triangle D_2E_2F_2$  be the anticomplementary triangle of  $\triangle DEF$ . It is obvious that  $X, Y, Z$  are orthogonal projections of  $P$  on  $E_2F_2, F_2D_2, D_2E_2$ . Let  $I$  be circumcenter of  $\triangle D_2E_2F_2$ , then according to Fontene's theorem,  $\odot(XYZ)$  passes through orthopole of  $IP$  wrt  $\triangle D_2E_2F_2$ . But, orthopole of  $IP$  wrt  $\triangle D_2E_2F_2$  is also the anti-Steiner point of  $IP$  wrt  $\triangle DEF$ . This implies that  $\odot(XYZ)$  passes through  $T$ . Hence  $\odot(A'B'C'), \odot(DEF), \odot(XYZ)$  are concurrent.

Note that, in the inverse problem, the concurrency of  $\odot(DE'F'), \odot(EF'D'), \odot(FD'E'), \odot(DEF), \odot(A'B'C')$  was found by Nguyen Van Linh. That is the main idea of the proof by Tran Minh Ngoc.

Another proof by Michael Rolinek and Le Anh Dung was published to Forum Geometricorum.

## 2.2 Problems

**Proposition 19.** *Nine-point circles of  $\triangle ABC, \triangle PBC, \triangle PCA, \triangle PAB$ , pedal circles of  $P, A, B, C$  wrt  $\triangle ABC, \triangle PBC, \triangle PCA, \triangle PAB$ , respectively and cevian circle of  $P$  wrt  $\triangle ABC$  are concurrent.*

The above proof implies this property.

**Proposition 20.**  *$P', P^*$  are isogonal conjugate and cyclocevian conjugate of  $P$  wrt  $\triangle ABC$ .*

i) *Poncelet point of  $A, B, C, P'$  is  $T$ .*

ii) *Poncelet point of  $A, B, C, P^*$  is  $M$ .*

**Proposition 21. (Luiz Gonzalez and Cosmin Pohoata)** *Given  $\triangle ABC$  and a point  $P$ .  $\triangle DEF$  is pedal triangle of  $P$  wrt  $\triangle ABC$ .  $PD, PE, PF$  intersect  $\odot(DEF)$  at  $X, Y, Z$ .  $A_1, B_1, C_1$  are midpoints of  $PA, PB, PC$ .*

*Then  $XA_1, YB_1, ZC_1$  pass through Poncelet point of  $A, B, C, P$ .*

This is a homothetic corollary of proposition 9.

**Proposition 22.** *Poncelet point is center of rectangular hyperbola that passes through  $A, B, C, P, H$  where  $H$  is orthocenter of  $\triangle ABC$ .*

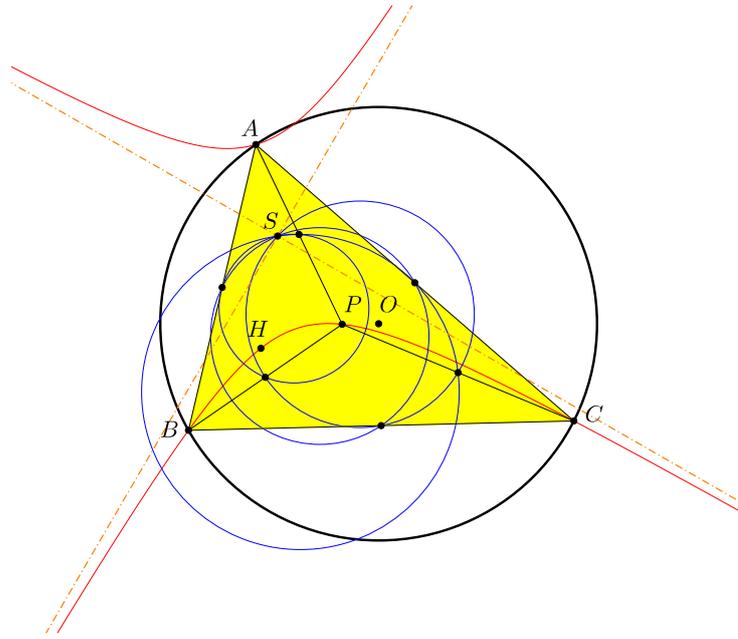

Figure 19

**Proof.** From Feuerbach's conic theorem,  $\triangle ABC$  is inscribed in rectangular hyperbola  $\mathcal{H}$  then nine-point circle of  $\triangle ABC$  passes through center of  $\mathcal{H}$ , then nine-point circle of  $\triangle ABC$ ,  $\triangle PBC$ ,  $\triangle PCA$ ,  $\triangle PAB$  are concurrent at center of the rectangular hyperbola passes through  $A, B, C, H, P$ . To end this paper, I present a hard and difficult problem.

**Proposition 23. (Francesco Sala)**  $P, Q$  are isogonal conjugate wrt  $\triangle ABC$ .  $X$  is Poncelet point of  $A, B, C, P$ .

$\triangle Q_A Q_B Q_C$  is pedal triangle of  $Q$  wrt  $\triangle ABC$ .  $PX$  intersects  $\odot(Q_A Q_B Q_C)$  at  $Y$ .

Then Steiner line of  $Y$  wrt  $\triangle Q_A Q_B Q_C$  is parallel to orthotransversal of  $P$  wrt  $\triangle ABC$ .

**Proof.** An important step in the solution of this problem is using the following lemma.

**Lemma 24. (Telv Cohl)** Let  $H_Q$  be orthocenter of  $\triangle Q_A Q_B Q_C$ . Then  $H_Q Q \perp$  orthotransversal of  $P$  wrt  $\triangle ABC$

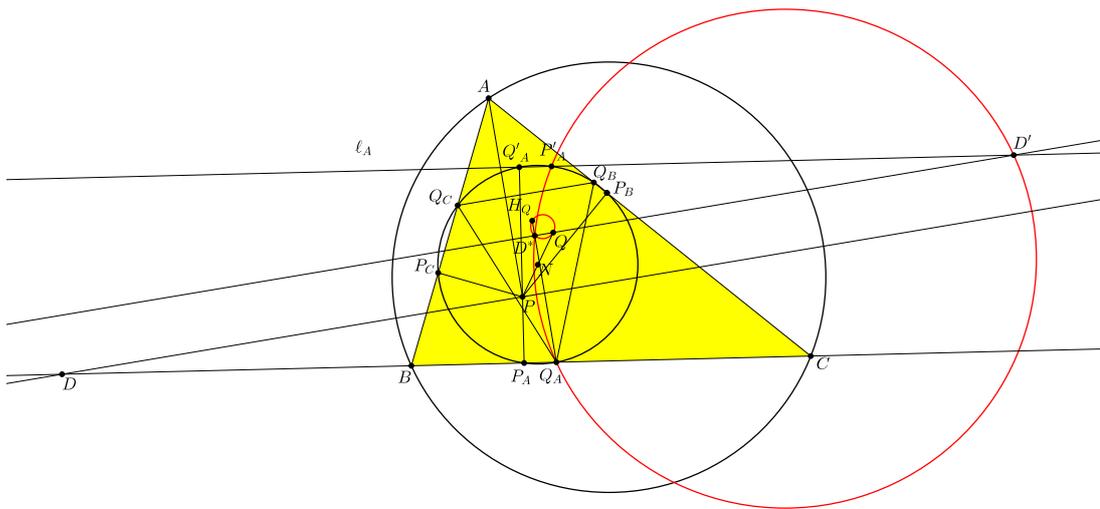

Figure 20

Telv Cohl also proved this lemma.

Let the orthotransversal intersects  $BC, CA, AB$  at  $D, E, F$ .

Let  $P'_A, P'_B, P'_C, Q'_A, Q'_B, Q'_C$  be the antipode of  $P_A, P_B, P_C, Q_A, Q_B, Q_C$  in  $\odot(P_A P_B P_C)$ .

Let  $\ell_A$  be the line through  $Q'_A$  and parallel to  $BC$  (define  $\ell_B$  and  $\ell_C$  similarly).

Let  $D'$  be a point on  $\ell_A$  such that  $QD' \parallel Q_BQ_C$ .  $PD'$  intersects  $H_QQ_A$  at  $D^*$   
 $\Rightarrow D', D^*, Q_A, P'_A$  are concyclic, then  $\overline{QD'} \cdot \overline{QD^*} = \overline{QQ_A} \cdot \overline{QP'_A} = \mathcal{P}_{Q/\odot(Q_AQ_BQ_C)}$ . Similarly, we have:

$$\overline{QE'} \cdot \overline{QE^*} = \overline{QF'} \cdot \overline{QF^*} = \mathcal{P}_{Q/\odot(Q_AQ_BQ_C)}$$

Since  $D^*, E^*, F^*$  lie on  $\odot(H_PP)$  so by inversion,  $D', E', F'$  are collinear on the line that perpendicular to  $H_QQ$ .

Furthermore,  $D'$  is reflection of  $D$  in center  $N$  of  $\triangle P_AP_BP_C$  so  $QH_Q \perp$  orthotransversal of  $P$  wrt  $\triangle ABC$ .

### Back to the main problem

$A_1, B_1, C_1$  are midpoints of  $PA, PB, PC$  then by proposition 21,  $A_1Q'_A, B_1Q'_B, C_1Q'_C$  pass through  $X$ .  $\triangle P_AP_BP_C$  is circumcevian triangle of  $P$  wrt  $\triangle Q'_AQ'_BQ'_C$ , then according to remark in proposition 9,  $Y$  is anti-Steiner point of  $PH'_Q$  wrt  $\triangle Q'_AQ'_BQ'_C$  where  $H'_Q$  is orthocenter of  $\triangle Q'_AQ'_BQ'_C$ .

Since  $\triangle Q_AQ_BQ_C$  is reflection of  $\triangle Q'_AQ'_BQ'_C$  in center of  $\odot(P_AP_BP_C)$  then  $Y$  is reflection of anti-Steiner point of  $H_QQ$  wrt  $\triangle Q_AQ_BQ_C$  in center of  $\odot(P_AP_BP_C)$ . Hence Steiner line of  $Y$  wrt  $\triangle Q_AQ_BQ_C$  is perpendicular to  $H_QQ$ .

In the last words of this paper, I want to say, around these circles, these intersections still have so many interesting problems. I tried my best to collect the problems that in my capability. I hope that we can return to this topic in other time.
